Marthaelsesoi... 1, 1, Jun 14, 2020 02:28AM.Psychosocial and physical functioning in rural women with pelvic organ prolapse. To examine psychosocial and physical functioning in women residing in rural areas with symptomatic pelvic organ prolapse (POP). A descriptive correlational design was used to examine psychosocial and physical functioning in pelvic organ prolapse (POP) patients (n = 20) from two rural communities. Data were collected during medical visits, personal interviews, and clinical examinations. Descriptive statistics were used to determine means and standard deviations. Pearson's correlation coefficients examined associations between psychosocial and physical functioning and between subscales of the Iowa Infertility Potential Inventory. Results showed that patients reported more physical than emotional complaints, physical limitations, and sexual problems compared with patients in a previous study (n = 23). After adjusting for anxiety, depression, and marital status, no significant associations were found between any of the psychosocial and physical function subscales and prolapse severity. Patient symptoms related to depression, sexual complaints, dyspareunia, and urinary incontinence were associated with psychosocial functioning. The Iowa Infertility Potential Inventory (IIP) was a more useful measure than the Pelvic Organ Prolapse Distress Inventory (POPGI) with regard to comparing results between studies. This study suggests that women with symptomatic POP may have greater physical rather than emotional distress. The use of high-resolution contact lens ophthalmic chromatography for the measurement of aqueous humor dynamics. Aqueous humor dynamics was measured by using a newly developed high-resolution contact lens ophthalmic chromatography (CLOC) technique. The method is based on HPLC (high-pressure liquid chromatography) technology combined with the principle of nephelometry. The method is based on the separation of three compounds by HPLC. They include a marker compound used for standardization, an internal standard compound to adjust the variations of the results, and a sample compound to be determined. The equipment used in the method includes a DPC-600 UV/Vis detector, HAT-IR detector, and DPC-1 R60 controller. The chromatographic column and gradient were optimized to achieve the highest sensitivity and selectivity. Aqueous humor samples from 56 subjects were measured. They included 25 volunteer subjects in their early 20s, 21 volunteer subjects in their late 20s, and 50 elderly subjects. The variation coefficients of the 26 measured subjects were all within f678ea9f9e
